

Managed Services Virtual Private Network (VPN)

Solution1 delivers everything you need to connect your business securely and safely. From **single-site solutions** to **complex multi-site VPNs**, we manage the **entire solution** and deliver it over our **private UK network**. We uniquely bond **multiple connections**, providing you with **high speed inter-site bandwidth** and remember, once you're connected, you gain access to a wealth of other datacentre services.

Getting more out of your network

Solution1 uniquely 'load-balances' multiple connections to deliver a high performance, high speed virtual private network, enabling you to make major savings as a result. This quality managed service is delivered anywhere in the UK, irrespective of distance.

Connecting your business

Solution1's VPN services give secure access for remote office locations, travelling employees and home workers, and are provided via our dedicated datacentres right to your office. Our Digital Subscriber Line (DSL) services are delivered over our private Wide Area Network, avoiding the public internet, so you gain high levels of security and control.

How our fully managed VPN services make the difference

High bandwidth means capacity is never in doubt, for high speed, high performance with predictable monthly costs.

Quality

- A clear service level agreement guarantees solution quality
- We only use leading products and services from partners with whom we have a proven and long-standing relationship
- All information on your VPN is encrypted for total security
- Our technology fully supports IPSEC, the common standard for VPNs. Our fully compliant solution maintains a high level of flexibility, and works securely over wireless networks such as WiFi and WLAN.

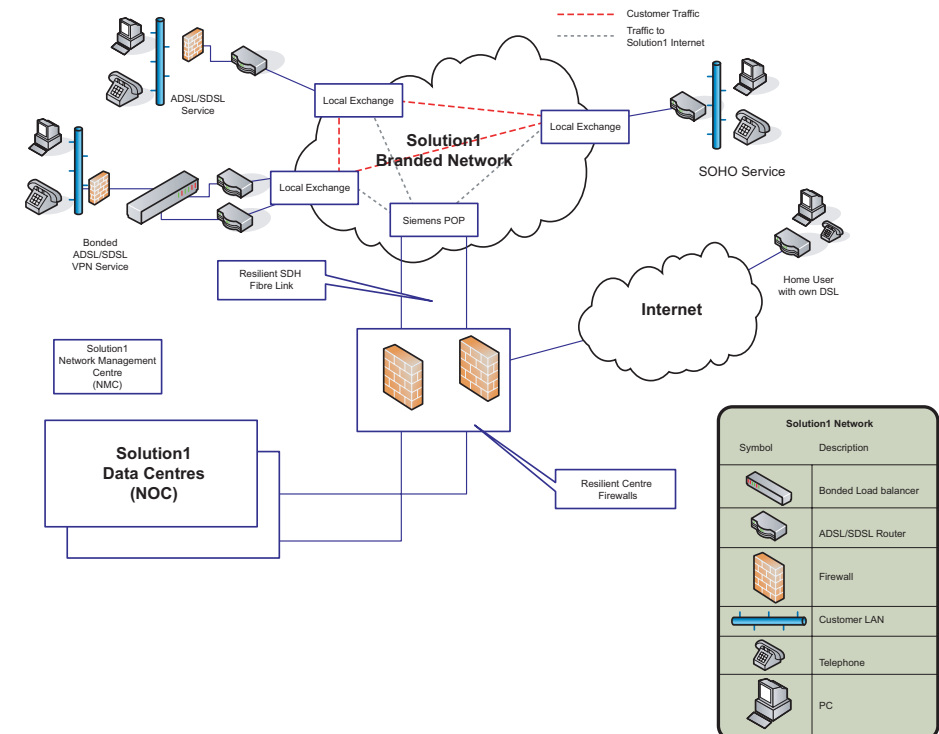

Performance

- So your communications always remain fast and full of capacity, we run a non-contended service from our datacentres. This provides you with multiple carrier services for both Internet Protocol (IP) and traditional communications services.
- Advanced features such as Quality of Service (QoS) enable you to run business critical applications such as Voice Over IP (VOIP).
- Unique 'bond and load-balanced' DSL connections give you high speed VPN services and fast internet connectivity at a fraction of the cost for a leased line.
- Your data is encrypted between locations. Security is further boosted by managed firewall solutions which create a 'force field' around your entire business.

Management

- The Lifetime helpdesk supports you and your business. 365/24/7 helpdesk services are available as a service option.
- Onsite appliances are supplied, preconfigured and tested prior to installation, enabling us to ensure the solution is entirely secure.
- All equipment and services are fully managed, remotely monitored and delivered from a centrally secure point.

Think – if your organisation operates a number of geographically-spread offices or supports travelling employees, you can save money on expensive leased line networks and dial up connections.
